Software Engineer

Software Engineer (2+ YOY) with full-stack experience delivering AI-powered SEO and content tools for 1,700+ enterprise users at Faber Company. Strong background in Java, Spring Boot, and AWS, with leadership as Scrum Master for a 6-member team. Passionate about scalable architecture, performance optimization, and building developer tools that solve real-world problems.

Skills

Languages

Java, Typescript, Javascript, HTML, CSS

Databases

MySql, MongoDB, PostgreSQL

Framework

Backend: Spring boot, NestJs, Encore.ts
Frontend: NextJs, Angular, Tailwind CSS, SASS
Testing: Junit 5, Test Container

Cloud & Devops

AWS ECS, EC2, Lambda, S3, Cloudwatch, Elasticache (Redis), SQS
Google Cloud Run, Docker, Github actions, CI/CD pipeline

Soft skills & teamworks

Scrum Master for 6-member team: Sprint planning, retros, mentoring
Strong problem-solving mindset: Performance tuning, concurrency, system design
Clear communication: Led team discussions, helped align sprint goals
Self-driven: Built side projects used internally or deployed globally

Experience

Mieruca SEO

Faber Company
2024/01 - Present

Software Engineer & Part-time Scrum Master

Technical lead on two prime Mieruca SEO features, scaling performance and reliability.

- **Headline Generation:** Rapidly produces compelling, SEO-friendly headlines and content drafts, boosting efficiency and relevance.
- **AI Article Generator:** Automates creation of high-quality, long-form articles, significantly streamlining content production and enhancing search performance.
- **Search Monitor:** Applied multi-threading & SQS to cut latency by 70%, errors by 90%; scaled to thousands of domains and million keywords per day.
- **API Migration:** Rewrote legacy, slow-performing APIs using modern frameworks (e.g., Spring Boot); improved response times and maintainability.
- **API & CI/CD Optimization:** Refactored Java APIs; improved performance to <10s and release reliability to 99.9%.
- **Test Automation:** Introduced integration tests with JUnit/TestContainers; boosted coverage from 0% to 80% in key projects.
- **Concurrency Limiter:** Designed shared service to control heavy customer processes, ensuring stability.
- **AWS Resource Management:** Managed and optimized AWS infrastructure to ensure cost efficiency, scalability, and high availability.
- **Scrum Leadership:** Mentored 6 devs, ran sprints with 100% on-time delivery using planning poker and clear sprint goals.

Projects

Global News Collector

2024/10 - Present

Developed a platform that aggregates and analyzes global news from top publishers in Vietnam, Japan, the USA, and more. The architecture features a modular NLP pipeline for sentiment analysis and keyword extraction, with data flow orchestrated by Pub/Sub and Encore.ts.

- News Aggregation Engine: Crawls data from top publishers in Vietnam, Korea, USA, Germany, and more using Playwright on AWS Lambda and Google Cloud Run.
- NLP Pipeline: Designed modular stages for sentiment analysis, keyword extraction, and topic clustering.
- Distributed Architecture: Orchestrated data flow (crawl → analyze → store) using Pub/Sub and Encore.ts's built-in cron jobs.
- Future Expansion: Plans to ingest Facebook/TikTok content and store enriched data in a vector database for semantic querying.

Tech Stack: Encore.ts, Playwright, AWS Lambda, Google Cloud Run, Pub/Sub, NLP (custom pipeline), vector database (planned)

Sprint Planning Poker

2025/06 - Present

<https://sprint-planning.cloud>

Reduced sprint delays from 30% to 0-5% by developing and globally deploying a collaborative estimation tool for Scrum teams. The tool supports real-time story point voting and sprint reports.

- Designed as a game to align team understanding and workload before sprint start; reduced sprint delays from 30% → 0-5%.
- Enabled real-time story point voting, sprint reports, and task rescheduling based on team feedback and capacity.
- Globally deployed with Next.js, Firebase Auth, Firestore, Ably WebSocket, and Tailwind CSS on GCP Cloud Run for scalability and low cost.
- Future plans: AI-assisted point suggestions, historical velocity tracking, and JIRA integration for workflow automation.

Tech Stack: Next.js, Firebase Auth, Firestore, Ably (WebSocket), Tailwind CSS, GCP Cloud Run

Hoc Voi AI

2023/08 - 2024/04

Built a self-learning platform where users create, manage, and share personalized learning roadmaps. Integrated ChatGPT API to auto-generate roadmaps for faster onboarding and goal alignment.

- AI Roadmap Generator: Used OpenAI's GPT API to suggest step-by-step learning paths tailored to user goals.
- Custom Roadmap Builder: Designed UI/UX for users to create and organize their own educational journeys.
- Modular Architecture: Split into 3 services – ReactJS frontend, NestJS backend, and a Flask API client – to decouple AI integration and support future scaling.
- Public Sharing: Enabled users to share roadmaps with unique URLs to inspire or guide others.

Tech Stack: ReactJS, NestJS, Flask, OpenAI API, PostgreSQL

Education

Information and Technology
